About Role
Senior AI Engineer – Ofgem

What the role is really about (from the agent conversation)

1. Ofgem's intent (why this role exists)

This is **not a "research AI" or experimentation-heavy role**.
Ofgem is under pressure to:

- Improve **regulatory intelligence**
- Scale analysis across **energy markets, suppliers, and consumer data**
- Reduce manual investigative and reporting effort
- Introduce AI **safely, transparently, and defensibly** in a public-sector regulator

The role exists to **turn AI into a dependable operational capability**, not demos.

---

2. Core mission of the role

You are being hired to **engineer AI systems that support regulation, oversight, and decision-making**, while standing up to:

- Public scrutiny
- Audit
- Legal challenge
- Parliamentary review

In short:
"Build AI we can defend."

---

3. What "Senior" means in this role

From the conversation, *senior* does **not** mean:

- People management
- Pure architecture diagrams
- Academic ML depth

It **does** mean:

- Owning AI components end-to-end (design → build → deploy → operate)
- Making good engineering trade-offs in a regulated environment
- Acting as a technical authority other engineers and policy teams trust

You're expected to **lead technically by doing**, not by title.

---

4. Day-to-day focus (practical reality)

You will spend most of your time on:

AI Engineering

- Building production-grade ML / AI services (Python-first)
- Working with structured + unstructured datasets (reports, market data, supplier submissions)
- Applying ML, NLP, and increasingly GenAI where it *adds value* (not for hype)

Data & Pipelines

- Integrating AI into existing data platforms (batch + analytical workflows)
- Ensuring repeatability, traceability, and explainability of outputs

Responsible AI

- Making models interpretable
- Logging decisions, assumptions, and limitations
- Designing for human-in-the-loop review

Collaboration

- Working closely with:
    - Policy teams
    - Analysts

    - Data engineers
    - Legal / governance stakeholders

This is **deeply cross-functional**.

---

5. What Ofgem is cautious about (clear signals from Anette)

The conversation made it clear they are deliberately avoiding:

- "Black box" AI
- Over-automation of regulatory decisions
- Models that can't be explained to non-technical audiences

They want:

- Conservative, well-governed AI
- Incremental rollout
- Clear accountability boundaries

This is **AI as decision support**, not AI as decision-maker.

---

6. Technology expectations (implicit, not buzzword-driven)

From how the role was described, they care more about:

- **Strong Python engineering**
- Clean, testable ML code
- Sensible model choices
- Good data handling
- Reproducibility and documentation

…than about chasing the newest frameworks.

GenAI is **in scope**, but only where it clearly improves:

- Analysis
- Summarisation
- Regulatory insight
- Analyst productivity

---

7. What success looks like in 6–12 months

If you were doing well in this role, Ofgem would say:

- "We trust these AI outputs"
- "This reduced analyst workload"
- "We can explain this to auditors"
- "This system is now part of how we regulate"

That's the bar.

One-sentence executive summary (agent-accurate)

A Senior AI Engineer at Ofgem builds and operates explainable, production-grade AI systems that support regulatory oversight of the UK energy market, balancing engineering rigor, data integrity, and public-sector accountability.

If you want, next we can:
